

ABSTRACT

Multi Label Verification System

5 The present application relates to techniques and systems
which employ labels, for example on articles such as
consumer products and their packaging, in order to verify
the authenticity of those articles, and/or to allow
unauthorised tampering of those articles to be detected
10 and/or to allow tracking and tracing of those articles. An
system is provided having at least one primary label and
at least one secondary label. There exists an association
between the information contained in the or each secondary
label and one or more of the properties of the or each
15 primary label so that unauthorised tampering of the
articles to which the labels are attached can be detected.
